

As part of access roads network to newly developed amusement park several bridges have been constructed as a connection between Sheikh Zayed Road and entrance to the park.

During construction of the one of the bridges (Bridge 5), one bearing on Pier 10 was found dysfunctional.

Contractor assigned Freyssinet to conduct lifting of the structure to allow bearing replacement.

After approval of Freyssinet design and methodology for lifting work, full activity on site was completed within 3 days respecting all project QHSE requirements.
